Recuerda que, a la hora de operar con fracciones es conveniente:

Simplificar las fracciones antes, durante y después de los cálculos.

Trabajar siempre con la fracción irreducible nos ahorrará cálculos innecesarios y trabajaremos con números más pequeños, lo que reducirá considerablemente la probabilidad de error.

Respetar el orden de prioridad de las operaciones.

Corchetes, paréntesis, potencias, multiplicaciones y divisiones y por último sumas y restas nos evitaran errores de cálculo.

Reducir a común denominador las fracciones solo a la hora de sumar y restar.

Reducir a común denominador, usando el m.c.m. de los denominadores, solo se hace para sumar o restar, nunca hacerlo para multiplicar porque los números se harán muy grandes y luego perderemos mucho tiempo para simplificar.

$$\frac{1}{2} + \frac{1}{3} - \frac{3}{6} = \{m.c.m.(2,3,6) = 6\} = \frac{3\cdot1}{6} + \frac{2\cdot1}{6} - \frac{3}{6} = \frac{3}{6} + \frac{2}{6} - \frac{3}{6} = \frac{3+2-3}{6} = \frac{2}{6} = \frac{1}{6}$$

Recuerda que, para operar con fracciones, hemos de seguir un orden:

- Se opera utilizando el orden de prioridad de las operaciones: Primero corchetes, luego paréntesis, después potencias y raíces, más tarde productos y cocientes y por último sumas y restas.
- Para sumar o restar, se reducen las fracciones a común denominador mediante el m.c.m.
- ★ Se simplifica el resultado. (Se recomienda simplificar en los pasos intermedios para facilitar los cálculos)
